ELEPHANT HERPESVIRUS DISEASE ALERT

The cause of a highly fatal disease of elephants in North American and European Zoos has been identified recently as a new type of herpesvirus. The herpesvirus affects mainly young elephants and usually has a fatal outcome within an hour to a week of onset. Clinical signs are variable and include lethargy, edematous swellings of the head and thoracic limbs, oral ulceration and cyanosis of the tongue. Necropsy findings include extensive cardiac and serosal hemorrhages and edema, hydropericardium, cyanosis of the tongue and oral and intestinal ulcers. Histological features are microhemorrhages with very mild inflammation in the heart, liver and tongue accompanied by intranuclear inclusion bodies in the capillary endothelium. Transmission electron microscopy of the inclusion bodies shows 80-90 nm diameter viral capsids consistent with herpesvirus morphology.

Serological tests have been recently developed (2002) using molecular techniques to express antigens because it has not been possible to cultivate the virus in vitro. Some of the epidemiological aspects of the disease are not yet clear and are still under study. Although African elephants are known to carry the virus that is fatal for Asian elephants, there have been a number of cases in Asian elephants in which no direct contact occurred with African elephants. Asian calves (less than two years of age) from different facilities in the U.S. became ill with the clinical signs noted above, and were found to have the herpesvirus by a blood test using polymerase chain reaction (PCR). Of seven elephants that were treated with famciclovir, three recovered. The onset of the disease may be very rapid with few prodromal signs and peracute death within 24 to 36 hours. This occurred in 1999-2000 in a six and eight year old Asian elephant that both died even through famciclovir was administered several hours after herpes infection was suspected.

If you suspect an elephant in your care may have died from this disease or shows clinical signs, please contact one of the principals listed below. Consult the Tissue Checklist section of this necropsy protocol for instructions on sending diagnostic samples from any elephants suspected of having this disease. Serum samples from sick or dead elephants should be obtained for diagnostic testing in any suspected case of herpesvirus infection.

ELEPHANT TUBERCULOSIS ALERT

An intense search for lesions of tuberculosis (TB) is encouraged in all elephant necropsies. This should include all elephants that die or are euthanized for other reasons even though TB is not suspected. Be advised that elephant TB is likely to be caused by Mycobacterium tuberculosis which is contagious to humans. Therefore be prepared with proper protective apparel, and contain any suspicious organs or lesions as soon as possible.

Ideally, elephants should be bled for serology (ELISA), and trunk wash(es) collected just prior to euthanasia. Elephants that die naturally should have a post mortem trunk wash performed and serum should be harvested from post mortem blood for serological assays. Consult Guidelines for the Control of Tuberculosis in Elephants 2003 (www.aphis.usda.gov/ac/TBGuidelines2003.html).
All elephants undergoing necropsies should have a careful examination of the tonsillar regions and submandibular lymph nodes for tuberculous appearing lesions. All lymph nodes should be carefully evaluated for lesions since other sites may also be infected (ex. reproductive or gastrointestinal tract). Take any nodes that appear caseous or granulomatous for culture (freeze or ultrafreeze), and fixation (in buffered 10% formalin). In addition, search thoracic organs carefully for early stages of TB as follows: after removal of the lungs and trachea, locate the bronchial nodes at the junction of the bronchi from the trachea. Use clean or sterile instruments to section the nodes. Freeze half of the lymph node and submit for TB culture to NVSL or a laboratory experienced in mycobacterial culture and identification (even if no lesions are evident). Submit sections in formalin for histopathology. Carefully palpate the lobes of both lungs from the apices to the caudal borders to detect any firm B-B shot to nodular size lesions. Take sections of any suspicious lesions. Open the trachea and look for nodules or plaques and process as above. Regional thoracic and tracheal lymph nodes should also be examined and processed accordingly. Split the trunk from the tip to its insertion and take samples of any plaques, nodules or suspicious areas for TB diagnosis as above. Look for and collect possible extra-thoracic TB lesions, particularly if there is evidence of advanced pulmonary TB.

Consider submitting cultures of liver, spleen, reproductive organs, and mesenteric lymph nodes for TB especially if there are suspicious lesions. One elephant has been diagnosed with a uterine TB infection.

For further information on laboratories performing diagnostic tests for TB, consult *Guidelines for the Control of Tuberculosis in Elephants 2003*. In the event of an elephant necropsy (elective or otherwise), please notify Dr. R. J. Montali, AZA-Elephant SSP Pathology Advisor, National Zoo, Washington DC, W: 202-673-4869, H: 703-718-2870; Cell: 703-863-0186; E-mail: montalir@nzp.si.edu, for further instructions and possible participation.

**INTERNET SITES**

INTRODUCTION

This protocol is an effort of the Elephant Species Survival Plan (SSP) Propagation Group of the American Zoo and Aquarium Association (AZA) and the Elephant Research Foundation. Its purpose is to provide a format for the systematic collection of information and samples that will add to our knowledge of elephants. All North American institutions holding elephants will receive a copy.

We hope that most institutions will not have to face the immense task of immobilizing or performing an elephant necropsy, but if this occur, it should be viewed as an important learning opportunity. Although it may not be feasible to collect all the information and samples requested, we encourage the collection of as much as possible. With the increased availability of digital cameras, it is strongly recommended that photographs of both normal and pathologic structures be recorded for future reference.

Sample and data collection information for research is contained in this document. (Specific necropsy information is contained in a separate document, Elephant Necropsy Protocol.) The Search List describes those parts of the anatomy for which data is lacking or about which previous observations need to be confirmed or refuted. The Measurements Checklist may seem tedious, but only this type of attention to detail will allow us to expand our knowledge of elephant anatomy. Both of these requested data sets are optional and included in this document. Some of these observations may be applied to live animals. Therefore, this protocol should be referred to when planning a procedure that might facilitate data collection. Please send the completed measurements checklist to Dr. J. Shoshani (contact information on page 11) and a copy to Dr. Michele Miller.

Acquainting oneself with the protocols in both documents (Elephant Necropsy Protocol and Elephant Research and Tissue Request Protocol) and having the necessary equipment ready will facilitate sample collection. A team should be designated in advance for data and sample collection to save valuable time. A list of researchers interested in participating in elephant necropsies is included in the Elephant Necropsy Protocol.

A revised Elephant Research and Tissue Protocol will be forwarded periodically as new requests are received and projects end. Contact Dr. Michele Miller for current requests. A copy of the completed data should be sent to the appropriate researcher. A copy of the necropsy report should be completed and sent to Drs. R.J. Montali and Genny Dumonceaux (see Elephant Necropsy Protocol for details).

SEARCH LIST (OPTIONAL)

The following are anatomical features that need to be confirmed or refuted, or for which few data exist. They are not arranged in order of importance, but rather as one studies the elephant by regions from the tip of the trunk to the tip of the tail. Please be aware of these anatomical questions and attempt to obtain the needed additional data as you proceed in your dissection.

1. Record the number of toenails.
2. Weigh skin after dissection from limbs and carcass.
3. Search for sesamoids especially under tendons. There may be one at the proximal end of the humerus, but check other sites as well.
4. Obtain total skeletal weight. Remove as much soft tissue as possible.
5. Note any pathological conditions in the joints. Slight erosions on articular surfaces can be viewed best in fresh tissues and should be examined soon after death. Grooves and fractures on articular surfaces cannot be mistaken and should be sought. Look also for "joint mice," calcium deposits, and any other abnormal signs.
6. Measure the volume of the nasal passages by instilling water soon after death or by measuring the diameter of the passages at intervals (record total length of trunk and diameter of passages at intervals of 10 cm).
7. Look for the intercommunicating canal between the two nasal passages of the trunk and the associated fibrous arches by sectioning the trunk every 10-20 cm. These structures were described as being located 13 cm from the tip of the trunk in a young female Asian elephant. Other searches in adult Asian females have revealed neither the arches nor the canals (Shoshani et al., 1982).
8. Harvest the lenses from the eyes and weigh them (or keep intact eyes frozen).
9. Search for the trachea-esophageal muscle. This muscle is small and may be overlooked or cut during dissection so we suggest that a section about 20 cm posterior and 50 cm or more anterior to the bifurcation be removed and examined carefully outside the carcass. This muscle was found in only three of twelve elephants examined (Shoshani et al., 1982).
10. Examine the dividing arrangement of the arteries from the aortic arch. There are two possibilities three branches or two branches. In the three-branch arrangement the sequence is right subclavian, a trunk common to the two carotids and the left subclavian. In the two-branch arrangement, the right subclavian and the common carotids merge into one vessel and the left subclavian remains separate.

MEASUREMENTS (OPTIONAL)

This data sheet is a general guideline to the pre-euthanasia or post mortem measuring of an elephant. Refer to the anatomical diagrams, Figures 1 and 2. The numbering system begins at the trunk and continues in a clockwise direction. All measurements should be taken in a straight line, except when indicated otherwise. Measurements to be taken between corresponding points on opposite sides of the body are marked with a plus symbol (+). These should be taken in a straight line, essentially through, not around, the elephant. Calipers can be improvised from two long straight poles or straight edges. Place the end of each pole on one of the two points, keeping the poles parallel to one another. Measure the straight line distance between the free ends of the two parallel poles.

Skeletal remains; Asian or African (Exhibit; comparative collection). Rough flesh if possible and ship frozen or just freeze. Will pay shipping.

3. Dr. Bets Rasmussen  
   Professor of Biochemistry  
   Oregon Graduate Institute  
   20,000 NW Walker Rd  
   Beaverton, Oregon 97006 USA  
   Cell: 503-705-3719  
   Home: 503-621-1435  
   Fax: 503-748-1464  
   Email: betsr@bmb.ogi.edu

For any MALE ELEPHANT please call Bets Rasmussen immediately at 503-748-1263 or 503-621-1435. She will come on the next airplane as certain tissues are of extreme and immediate value in her studies.

Frozen at liquid nitrogen temperatures and maintained at dry ice temperature for shipping. Small pieces (1 cm by 0.5 cm in cryo tubes 1. temporal gland 2. Palatal pits 3. Incisive duct openings 4. Olfactory tissue 5. Liver 6. Ovary

Fixatives. Fixatives are available from Dr. Rasmussen. If there is an immediate need, contact your local medical school. Preferred fixative is 4% glutaraldehyde (EM grade) in a pH 7.2 buffer. Cut pieces for EM 0.5 cm². Save (in 10% buffered formalin) the larger section from which the EM piece was taken. If glutaraldehyde is not available submit tissues in 10% buffered formalin.

Vomeronasal organ (RNA & DNA studies; electron microscopy). See diagram a. Adults: Only the incisive ducts are requested. These paired
openings on the roof of the mouth are 1-2 cm in diameter, several cms posterior to the juncture of the mucosa of the mouth with the lip region.

**Fetal, neonates & young elephants.** The whole vomeronasal organ is requested. It is found in the vomer bone, dorsal and posterior to the incisive ducts. It is paired, pear-shaped and surrounded by cartilage. In immediately post-natal elephants it does not connect with the ducts. In these young elephants to obtain the organ, work dorsal/posteriorly from the ducts, looking for shiny white cartilage surrounding receptive tissue, which is hollow in the center. FIRST PRIORITY is (1 cm³) pieces frozen in cryotubes in liquid nitrogen. Second priority is fixed tissue.

**Palatal pits.** (Histological and cytological studies.) The palatal pits are dual series of small (smaller than VNO duct opening) openings (0-13), asymmetrically and bilaterally located along the approximate demarcation line in the upper head between the hard palate and the trunk. Push aside the upper lip to locate. Dissect out a pit (0.5-1.0 cm), making sure at least 2 cm of underlying tissue are included (4% buffered glutaraldehyde).

**Brain.** The anterior, olfactory bulb region is requested if the brain is being removed. Especially the anterior-ventral region where connections to olfactory turbinates and vomeronasal nerve occur. This is a special request and Dr. Rasmussen will be present for such procurement.

Minimum 5-10 ml frozen serum for SSP serum bank. Instructions for sample preparation: Serum samples should be separated within 1 hr of collection and frozen in 1-2 ml aliquots in cryovials. Freeze at –70C until shipment. Ship on dry ice or ice packs overnight to address above. Please complete serum bank submission form (see below) and send with shipment.

Intact elephant brain immersed in 3.5% paraformaldehyde. (For neurologic study) Studying quantitative comparative neuroanatomical aspects of mammalian cerebella. Part of the research has been dealing with the size and form of the unfolded cerebellar cortex. Duration of study: 2-5 years. Special instructions: Brains should be as intact as possible (after careful removal from skull), immerse in 3.5% paraformaldehyde fixative. Researcher will pay for shipping. CITES permit for shipping samples required.
Samples requested:
1) Three tissue blocks about 1 cm³ containing part of the lung visceral pleura with a small amount of lung attached
2) Three tissue blocks about 1 cm³ containing lung parietal pleura including a small amount of underlying intercostal muscle
3) Three tissue blocks about 1 cm³ containing parietal pleura overlying the diaphragm with a small amount of diaphragmatic muscle attached

Samples should be immediately placed in gluteraldehyde (see instructions). The elephant is the only mammal where the intrapleural space around the lung is obliterated by connective tissue. We believe it is an adaption to the fact that the elephant is the only mammal that can snorkel at a considerable depth. The histology of the visceral and parietal pleura is needed to test this. Duration of study: 12 months (starting fall 2003). Special instructions: The visceral and parietal pleural surfaces are connected by loose connective tissue in the elephant. It will be necessary to find a plane of separation within this connective tissue before taking the tissue samples requested above. This is usually easy to do with the finger or a blunt instrument.

Shipping instruction: First class mail. We shall pay for shipping.

Immersion Fixative  (3% Glutaraldehyde in 0.1 M Phosphate buffer)

<table>
<thead>
<tr>
<th>Chemical</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Na₂HPO₄</td>
<td>12.0 g</td>
</tr>
<tr>
<td>Na₂HPO₄ · H₂O</td>
<td>7.2 g</td>
</tr>
<tr>
<td>Glutaraldehyde (50%)</td>
<td>60 ml</td>
</tr>
<tr>
<td>Distilled H₂O</td>
<td>940 ml</td>
</tr>
</tbody>
</table>

Adjust pH to 7.4

Notes:
1) Make the fixative no more than a day before collecting tissue.
2) To make 1L immersion fixative, dissolve 12 b Na₂HPO₄ and 2.7 g Na₂HPO₄ · H₂O in distilled water, and then add 60 ml Glutaraldehyde (50%) (Polysciences, Inc.) to the buffer and mix. Adjust the buffer pH to 7.4.
3) After collecting tissues, immediately immerse the tissues in the 3% Glutaraldehyde fixative. Cover the tissues with some gauze or paper towel to prevent them floating when needed. Seal the tissues in a container with a tight lid and 2-3 layers of parafilm to prevent leakage.

Animal Information

Asian [ ]     African  [ ]               ISIS#  ____________  Studbook #  ______________
Name  ______________________      Age: _________  [  ]  actual  [  ]  estimate
Sex: [ ]  male    [ ]  female

SAMPLE COLLECTION INFORMATION

Date of sample collection:  ___________ Time of collection :  __________
Site of sample collection: [ ]  ear vein  [ ]  leg vein  [ ]  other:  ___________
Health status of animal: [ ]  normal  [ ]  abnormal
Fasted: [ ]  no  [ ] yes – how long ______________
Weight  ________________  [  ]  actual   [  ]  estimated
Type of restraint: [ ]  manual   [ ]  anesthetized/sedated  [ ]  behavioral control
Temperament of animal: [ ]  calm  [ ]  active   [ ]  excited

Type of blood collection tube:
[ ]  no anticoagulant (red-top)
[ ]  EDTA (purple)
[ ]  heparin  (green)
[ ]  other:  ___________________
Sample handling:  [ ] separation of plasma/serum by centrifugation
(choose all that apply)  [ ] stored as whole blood
[ ]  frozen plasma/serum
[ ]  other – describe  _______________________

TB EXPOSURE STATUS

[ ]  Known infected animal
[ ]  Known exposure to culture positive source within the past 12 months
[ ]  Known exposure to a culture positive source within the past 1-5 years
[ ]  No know exposure to a culture positive source in the last 5 years

TREATMENT INFORMATION

Is elephant currently receiving any medication or under treatment?  [ ]  yes  [ ]  no
If yes, please list drugs and doses:  _______________________________________
